Sex / Age	M /	Report Date/Time	15-08-2018 15:46:17
Modality	CT	Referring Physician	

## THICK SECTIONS LIMIT EVALUATION

### FINDINGS

A large well defined oval predominantly cystic lesion is noted along the body and tail of the pancreas measuring ~ 18.4 x 10.2 cms in size (TR x AP). The lesion does not show significant post contrast enhancement. The head and uncinate process of the pancreas appears normal. The splenic artery is seen abutting this lesion however no pseudoaneurysm seen. The body of the stomach is seen to be splayed by the lesion. Inferiorly it displaces small bowel loops. Minimal surrounding retroperitoneal fat stranding is seen. Similar morphology cystic lesion is noted along the anterior abdominal wall on the left side measuring ~ 3 x 2 cms in size. Liver: Normal size, shape & attenuation. No focal lesion. No intra or extra hepatic biliary radicle dilatation. PV and CBD are normal. Gall bladder is distended normally. Wall thickness is normal. No calculus or mass lesion. Spleen is normal in size, shape and attenuation. No focal lesion. IVC & aorta are normal. No para aortic lymphadenopathy. Kidneys are normal in size, shape and attenuation. No focal lesion. No calculus or hydronephrosis. Excretion of contrast is normal on both sides. Ureters are not dilated. Urinary bladder is distended normally. Wall thickness is normal. No calculus or mass lesion. Prostate is normal. No bowel mass is detected. No definite polyp is seen in lumen of small intestine or large intestine. No ascites.

### IMPRESSION

large well defined oval predominantly cystic lesion is noted along the body and tail of the pancreas - likely to represent an intrapancreatic pseudocyst
